

Plumbing and Heating

## "MAKING WATER WORK FOR YOU"

### Power Flushing Explained

KJS plumbing and Heating are experts when it comes to Power Flushing central heating systems. Our prices for completing this essential service are extremely competitive being **50% less than British Gas charges.**

Power flushing is a method used to clean out blocked or clogged heating systems. Old heating systems build up with debris in the pipes and tank. It is prudent to power flush a heating system immediately before fitting a new boiler to an existing system. This is to prevent possible future problems and if isn't carried out, it will completely invalidate the new boiler warranty. Many systems are found to contain corrosion and sludge, even if no flow problems have yet shown themselves.

Existing debris is often mobilised by alterations to the system/piping and the increased efficiency of the new boiler. This may then accumulate in the boiler heat exchanger, causing noisy operation, reduced efficiency and in many cases will cause failure of the boiler itself. The high efficiency and compactness of modern boilers, developed to minimise fuel costs and pollution, means that they are more susceptible to problems caused by debris in the system water.

The power flushing pump is simply connected into the heating system wherever most practicable. The powerful flow, combined with the latest heat activated chemicals will dislodge and mobilise The sludge deposits and corrosion which would resist traditional system cleaning methods.

Once the corrosion and sludge deposits have been loosened and mobilised, fresh clean water is forced through the heating system, pushing the contaminated water out. During this process, the radiators are individually flushed, without removing or disconnecting them from the system, by directing the full output of the pump through each radiator separately.
